1 Activity 类

1.1 findViewById

函数声明如下:

```
public view findViewById(int id);
```

该方法以组件的资源 ID 作为参数,返回一个视图对象。需要注意的事,赋值前,需要先将返回的 View 转型。

1.2 onCreate

函数声明如下:

```
void onCreate(Bundle);
```

当 Activity 子类被调用后, onCreate(Bundle) 方法会被调用, 用于初始化。 英文介绍如下:

Called when the activity is starting. This is where most initialization should go: calling setContentView(int) to inflate the activity's UI, using findViewById(int) to programmatically interact with widgets in the UI, calling managedQuery(android.net.Uri, String[], String, String[], String) to retrieve cursors for data being displayed, etc.

2 Button 类

2.1 setOnClickListener

函数声明如下:

```
void setOnClickListener(View.OnClickListener);
```

传入 SetOnClickListener() 方法的监听器参数一般是一个匿名内部类,例子如下:

```
import android.widget.Button;

public class Test extends AppCompatActivity
{
    private Button mTrueButton;

@Override
    protected void onCreate(Bundle savedInstanceState)
{
```

```
super.Oncreate(savedInstanceState);
10
11
                mTrueButton = (Button) findViewById(R.id.true_button);
12
                mTrueButton.setOnClickListener(new View.OnClickListener() {
13
                    @Override
14
                    public void onClick(View v){}
15
                });
16
17
           }
18
```
